

# MOST PrintToMe

## PrintToMe

The PrintToMe feature allows users to print documents from a local or remote PC to the MOST Server. MFPs are constantly being used by other employees, or can be unavailable due to paper jams, lack of supplies, or malfunctions. Printing documents to the MOST Server enables users to access them from any MFP on the network. With this convenient capability, users no longer have to worry about printing delays due to MFP availability.

## Workflow with PrintToMe

- User prints a document to the MOST Server Print Driver.
- The MOST Server recognizes the user and the name and type of the document that is being printed. All of this information is stored on the MOST Server.
- The user can go up to any MFP on the network and login to MOST on the MFP screen.
- MOST identifies the user and checks if the MOST Server is holding any of the user's documents.
- All of documents that the user printed to the MOST Server are listed on the PrintToMe tab of the MOST interface.
- The user can select the document needed, and print it directly to the MFP.
- All login requests and communication between the MFP and the MOST Server are encrypted using 512-bit SSL encryption.
